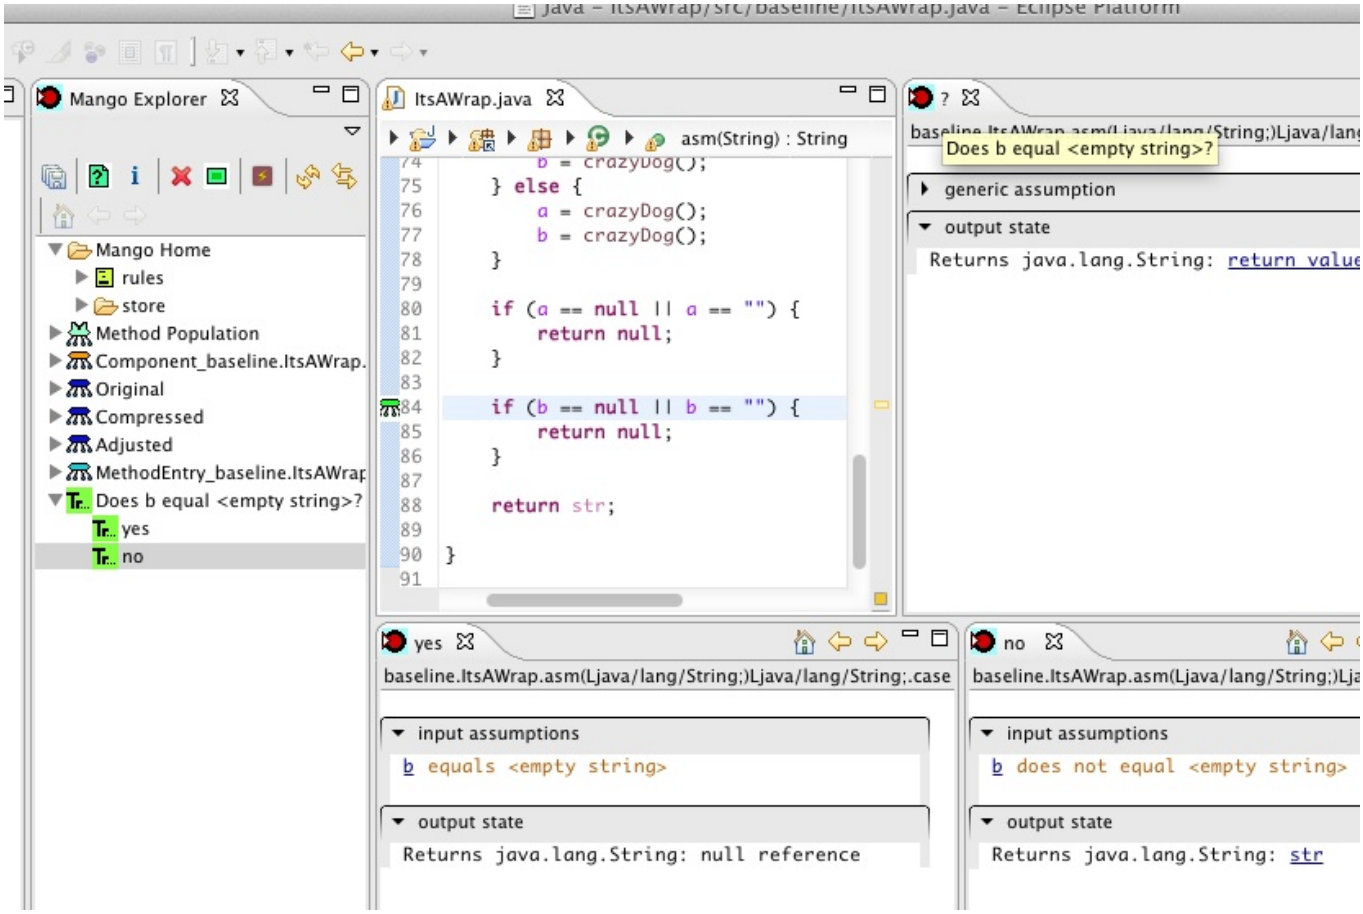
Note 4

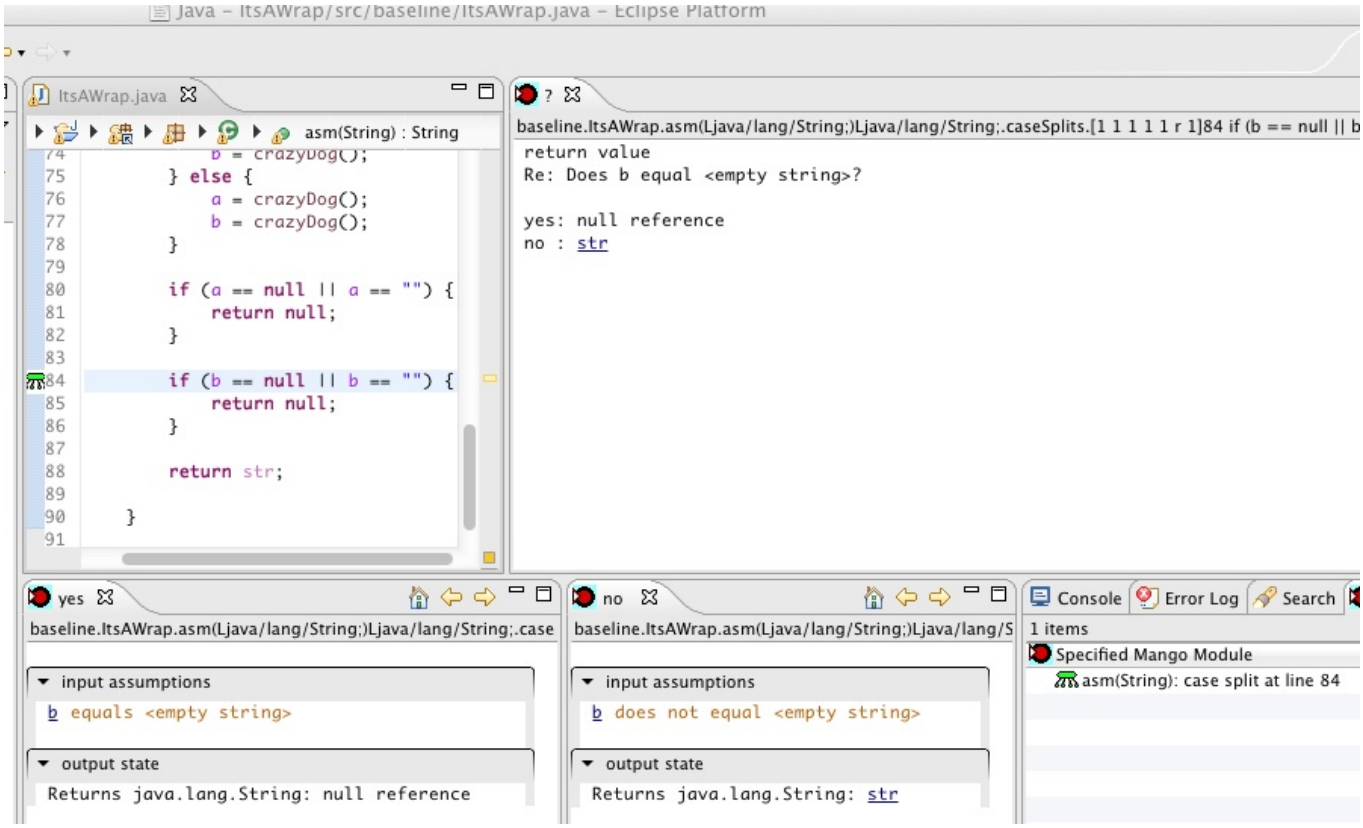
Boolean semantics for case splits

In this example, the case **b==""** is indicated by the green icon off to the left of line 84 of the code. Clicking on this icon reveals the case in the MangoExplorer, now in question-answer format. Clicking on the question yields the **?** view to the right of the code. The tool-tip reveals the question in yellow. Likewise, the **yes** and **no** cases are revealed in the views below the code.



Following a link

Clicking on the **return value** link opens a new page of the **?** view, displaying the possible return values for the corresponding cases.



Note

The positioning of views in this example is for illustrative purposes; by default, Mango generated views appear in the view panel of the perspective.
