CarRecall specification example

This example shows how Mango exposes cases splits to the user, if desired. Once generated, the specification may be navigated by opening folders in the Mango Explorer and following links in the revealed specification views.

Start by [loading](#) the FirstYearCode project.

On MacOSX, go to Eclipse>Preferences>"Mango Preferences". For other operating systems: Window>Preferences>"Mango Preferences".

Hit "Restore Defaults", in particular, "Suppress advice dialogs" and "Do not pause (Mango will make default choices)" should be unchecked.

Hit OK to close the preferences.

In the Package Explorer, in the FirstYearCode project, open src/firstYearCode/CarRecall.java.

In the [CarRecall](#) editor, double-click on "[CarRecall](#)" in the class declaration line "public class [CarRecall](#) {}". This will select both [CarRecall](#) and the [CarRecall](#) editor tab.

Right-click, Mango>populate. When the box in the Mango Explorer view becomes green, right-click, Mango>run.

At the first case split, Mango will notify the user of a pause. (see figure)
