Loading a test project

These instructions may be used to load FirstYearCode, ItsAWrap, or any other test code project distributed with the plugin.

1. Locate the eclipse folder which contains the Eclipse installation, in particular the Mango plugin. Unlike most plugins, Mango installs as a folder instead of a jar. The name of the plugin is **gov.nasa.jpf.mango_...**, (see figure).

1. From the Java perspective, File>New>"Java Project". Uncheck "Use default location", so that "Browse..." activates.
1. Browse to the project location. For ItsAWrap, you need to go inside the rbi folder. For FirstYearCode, just use the "FirstYearCode" folder.

1. If you have selected a Java project in the browser, the message "The wizard will automatically configure ..." will appear.
1. Finish. You may need to build the project if Project>Build Automatically is not checked.
