Welcome to the JPF Wiki

This is the main page for Java™ Pathfinder, or "JPF" as we call it from here. JPF is a highly customizable execution environment for verification of Java™ bytecode programs. The system was developed at the NASA Ames Research Center, open sourced in 2005, and is freely available from this server under the NASA 1.3 license.

The JPFWiki is our primary source of documentation. It is divided into the following sections (which you will always see in the TOC menu to the right):

- What is JPF? -- a brief introduction into JPF and what sets it part from normal testing
  - software model checking examples (as one possible JPF application)
- How to obtain and install JPF -- everything to get it running on your machine
  - System requirements
repository access from shell, Eclipse or NetBeans?
installing the Eclipse or NetBeans plugins

How to use JPF -- essentially the user manual for JPF
JPF application types and runtime components
configuring and running JPF
understanding JPF output
using the Verify API

Developer guide -- what's under the hood
the toplevel design
key mechanisms like ChoiceGenerators and partial order reduction
extension mechanisms? like Listeners, Search Strategies?, Model Java Interface (MJI), Bytecode Factories, Property checks?, Publishers?
running JPF from within your application
directory structure? and coding conventions
writing JPF tests

Projects -- descriptions of available JPF projects and repositories
Related Research and publications
About -- how are artifacts and work organized
About this Wiki
About the Development Process?
About the source repositories?
How to contribute
How to get a JPF contributor account

FAQ -- answers to all your questions (eventually)
History? -- how did we get here
Support -- who supports this project
People? -- who does or did contribute
News? -- what's going on right now
Future Plans? -- where do we want to go
